

PSMA Australia is the nation's most respected manager of spatial data, working with multiple government mapping agencies to access and integrate their geospatial data to create seamless, consistent national data sets for use by the public and private sectors. From administrative and cadastral boundaries to road and infrastructure data, PSMA Australia is the trusted source for authoritative national spatial data sets.

PSMA Australia's national coordinated approach is facilitated through the National Address Management Framework (NAMF), responsible for verifying and exchanging address information, and the Geocoded National Address File (G-NAF), the authoritative database for physical addresses used for address verification and geocoding.
